

Loops

- For loop ->
 - For i in { 1..5 }; do
 echo "count : \$i"
done
 - For ((i=0;i<3;i++));do
 echo "count is \$count"
done
- While loop ->
Execute a block of code as long as specific condition is true.
Count=1
While [\$count -le 3];do
 echo "count is \$count"
 count=\$((count+1))
done

Conditionals

if [condition]; then fi	if [condition];then elif [condition] else fi
---------------------------------------	--

Functions

- defining functions – function-name() {
 }
- calling functions – functiona-name()
- passing arguments to functions - \$1, \$2 \$3 inside function
- return values – return command terminates the function & passes numeric exit status
0 – means success
Anything other than 0 means failure or error
- Local variable – local variable is accessible only inside function. It ensure that you don't accidentally over write the global variables. The variable is automatically destroyed in memory as soon as funxtion finishes executing.

Text processing commands

- 1) awk → awk automatically split each line into fields using whitespace as delimiter
awk 'pattern { action }' filename
\$0 — Represents entire current line
\$1, \$2, \$3 — Represent first, second & third field
NR — keeps the track of current line number
NF — stores total number of fields in current line
FS — Field separator
